

1. Write down anything you notice different from Lab 2 assignment (hint: data generation)

In lab two the dead output numbers seemed to have decreased the larger the X value got, however, For lab three the data generated displayed in the scatterplot seems to have no consistent pattern. It seems to be just dots spread all across the graph

2. What python libraries are involved here?

Pandas library

3. How comfortable are you now in generating your own data set and plotting a histogram or a scatter plot? (if not briefly explain your problem )

Based on my prior knowledge as well as the information I gained through the data science labs, I am comfortable in my abilities to create scatterplots as well as histograms by generating my own data set.
